Preamble

1) Introduction

The University of Mumbai has brought into force the revised syllabi as per the National Education Policy (NEP 2020) for the First year B. Sc/B. A. Programme (Certificate Course) in Mathematics from the academic year 2024-2025. Mathematics has been fundamental to the development of science and technology. In recent decades, the extent of application of Mathematics to real world problems has increased by leaps and bounds. Taking into consideration the rapid changes in science and technology and new approaches in different areas of mathematics and related subjects like Physics, Statistics and Computer Sciences, the board of studies in Mathematics with concern of teachers of Mathematics from different colleges affiliated to University of Mumbai has prepared the syllabus of S.Y.B. Sc. (diploma course) Mathematics. The present syllabi of S. Y. B. Sc./ S. Y. B. A. for Semester III and Semester IV have been designed as per U. G. C. Model curriculum so that the students learn Mathematics needed for these branches, learn basic concepts of Mathematics, and are exposed to rigorous methods gently and slowly. The syllabi of S. Y. B. Sc./ S. Y. B. A. would consist of two semesters and each semester would comprise of four major courses for S. Y. B. Sc. / S. Y. B. A. Mathematics. These courses contain analysis, calculus, linear algebra, IKS (related with Mathematics), differential equations and practical course based on them. These courses develop strong logical thinking of learner and all these are having various applications in many recent trends of science and technology and practical component provides learner with handson experience in applying the theoretical concepts learned in all above courses and develops computation skill of learner.

2) Aims and Objectives

- 1) Give the students a sufficient knowledge of fundamental principles, methods, and a clear perception of in numerous powers of mathematical ideas and tools and know how to use them by modelling, solving, and interpreting.
- 2) Reacting the broad nature of the subject and developing mathematical tools for continuing further study in various fields of science.
- 3) Enhancing students' overall development and to equip them with mathematical modelling abilities, problem solving skills, creative talent, and power of communication necessary for various kinds of employment.
- 4) A student should get adequate exposure to global and local concerns that explore them many aspects of Mathematical Sciences.

3) Learning Outcomes

- 1. Real Analysis: This course gives introduction to basic concepts of Analysis with rigor and prepares students to study further courses in Analysis. Formal proofs are given lot of emphasis in this course which also enhances understanding of the subject of Mathematics as a whole.
- 2. Linear Algebra: This course introduces students to the foundational concepts of vector spaces, linear transformations, and matrices. Through theoretical exploration and problem-solving, students develop a solid understanding of linear independence, span, eigenvalues, eigenvectors and related properties. This course serves as a cornerstone for further studies in various fields such as mathematics, physics, engineering and computer science.

- 3. Ordinary Differential Equations: This course focuses on the theory and application of ordinary differential equations (ODEs). Students learn to analyze, solve, and interpret solutions to differential equations using analytical techniques.
- 4. Multivariable Calculus: This course extends the study of calculus to functions of several variables. In this course, through theoretical exploration and problem-solving, students develop a comprehensive understanding of multivariable calculus and its applications in various fields.
- 5. Indian Mathematics: This course gives the knowledge of the significant contributions of ancient Indian mathematicians and their profound influence on modern mathematics. They will be familiar with key concepts such as the development of numerals, early algebraic methods, combinatorics, and advancements in geometry, trigonometry, and calculus as seen in the works of Aryabhata, Brahmagupta, Bhaskaracharya. Additionally, students will develop analytical skills by exploring ancient problem-solving techniques and appreciate the historical context and cultural heritage of Indian mathematical traditions.

1	Description the course:	Real Analysis finds extensive applications in				
1	Including but not limited to:	diverse fields such as Physics, Chemistry,				
1		Biotechnology, Engineering, among others.				
		This course aims to instill a deep				
		understanding of Mathematical Analysis as it				
		forms a rigorous foundation for Calculus.				
1		Learners will explore properties of Real Numbers, delve into concepts like Series and				
	Riemann integration of functions. To provide					
	practical context, the course incorporates					
	applications of integration, offering students a					
		broader perspective on the diverse uses of				
`	Vertical:	acquired knowledge.				
<u>2</u> 3		Major Theory				
<u>3</u> 4	Type: Credits:	Theory 2 credits				
4		2 credits (1 credit = 15 Hours for Theory or 30 Hours of				
	(1 credit = 15 Hours for Theory of 30 Hours of Practical work in a semester)					
5	Hours Allotted:	30 Hours				
3	HVH 5 AUVILU.	50 110015				
6	Marks Allotted: 50 Marks					
7	Course Objectives (CO):					
	This course provides an introduction to advanced concepts in analysis with a strong emphasis on					
	rigor. It aims to prepare students for more advanced courses in abstract analysis. The focus of the					
	course is on developing formal proof skills, which not only deepens comprehension of the					
	subject but also extends to broader applications in mathematics.					
	CO1: Provide a solid understanding of fundamental principles and methods, equipping students					
	with the skills to apply mathematical ideas and tools through modeling, solving, and					
	interpretation. CO2: Illustrate the expansive nature of the subject by fostering the acquisition of essential					
	mathematical tools for continued studies across various scientific fields.					
		ment by placing emphasis on problem-solving				
	•	communication abilities, all of which are vital for				
	a range of employment opportunities.	and improve within the weather C. M. d				
		ocal issues within the realm of Mathematical				
ø	Sciences, allowing learners to explore diverse as	pects of the discipline.				
8	Course Outcomes (OC): After completion of the course, students will be	able to				
	After completion of the course, students will be a OC1 Understand and remember the concepts s					
	OC1 Understand and remember the concepts such as convergence/ divergence of series,					

Riemann Integration, beta-gamma functions and related results.

	OC2. And by the formula conditions to the optimum large late the second state of the s
	OC2 : Apply the formulae and concepts to solve the examples related to series, Riemann
	Integral, area between two curves etc.
	OC3 : Analyse the convergence and divergence of series and integrability of given function.
	OC4 : Justify/ check the integrability of function, absolute and conditional convergence of
	series.
	OC5: Construct counter examples related to absolutely convergent/ divergent series,
0	non-integrable functions etc.
9	Modules: - Module 1: Infinite Series (15 Lectures)
	Module 1: Infinite Series (15 Lectures)
	1. Infinite series in \mathbb{R} . Definition of convergence and divergence. Basic examples including
	geometric series. Elementary results such as if $\sum_{n=1}^{\infty} a_n$ is convergent then $a_n \to 0$ but converse
	is not true. Cauchy Criterion, Algebra of convergent series and related examples.
	2. Tests for convergence: Comparison Test, Limit Comparison Test (without proof), Ratio Test
	(without proof), Root Test (without proof), Examples, p- series test.
	3. Alternating series. Leibnitz's Test. Examples. Absolute convergence, absolute
	convergence implies convergence but not conversely. Conditional Convergence.
	Module 2: Riemann Integration and Applications (15 Lectures)
	1. Idea of approximating the area under a curve by inscribed and circumscribed rectangles. Partitions of an interval. Refinement of a partition. Upper and Lower Riemann sums for a
	bounded real valued function defined on a closed and bounded interval in \mathbb{R} . Definition of
	Riemann integral. 2. Criterion for Riemann integrability, Characterization of the Riemann integral as the limit of a
	sum. (without proof). Examples.
	3. Algebra of Riemann integrable functions and basic results such as if (i) $f:[a,b] \rightarrow \mathbb{R}$ is
	integrable, then $\int_{a}^{b} f(x)dx = \int_{a}^{c} f(x)dx + \int_{c}^{b} f(x)dx$ (without proof) (ii) f is integrable and
	$\left \int_{a}^{b} f(x)dx\right \leq \int_{a}^{b} f (x)dx \text{ (iii) If } f(x) \geq 0 \text{ for all } x \in [a,b] \text{ then } \int_{a}^{b} f(x)dx \geq 0$
	4. Riemann integrability of a continuous function. Integrability of a bounded function whose set
	of discontinuities has only finitely many points (without proof). Riemann integrability of
	monotone functions.
	5. First and Second Fundamental Theorems of Calculus.
	6. Area between the two curves. Lengths of plane curves. Surface area of surfaces of revolution.
	7. Gamma and Beta functions and their properties. Relationship between them (without proof).

Name of the Course: Linear Algebra -I

Sr.	Heading	Particulars			
<u>No.</u> 1	Description of the course: Including but not limited to:	This course offers a comprehensive introduction to linear algebra, focusing on systems of linear equations, matrix operations, and the theory of vector spaces. It begins with methods for solving both homogeneous and non-homogeneous linear equations, including Gaussian elimination and Cramer's Rule. Students will explore the concepts of elementary matrices, matrix invertibility, and the rank of a matrix, as well as their applications in determining the solvability of systems. The course also delves into the structure of vector spaces, examining subspaces, linear combinations, span, and the basis of a vector space, with a focus on understanding dimension and linear dependence/independence. By the end of the course, students will be equipped with the fundamental mathematical tools to solve complex problems in fields such as computer science, engineering, and economics, where linear systems and vector spaces are commonly applied			
2	commonly applied. Vertical: Major				
3	Туре:	Theory			
4	Credits:	2 credits (1 credit = 15 Hours for Theory or 30 Hours of Practical work in a semester)			
5	Hours Allotted: 30 Hours				
6	Marks Allotted:	50 Marks			
7	 Course Objectives (CO): The course seeks to provide students with a thorough grasp of linear algebra, emphasizing topics such as linear equations, matrices, and vector spaces. It offers various methods for analyzing systems of equations, aiming to improve students' numerical skills in linear algebra using matrices. Additionally, students will develop proficiency in real vector spaces by gaining a profound understanding of fundamental concepts. CO1: Develop problem-solving skills related to systems of linear equations and to analyze and interpret solutions to linear systems geometrically and algebraically. CO2: Apply matrix operations and elementary row operations to solve linear systems, and to understand the concepts of rank CO3: Apply Cramer's Rule to solve linear systems. CO4: To construct and analyze vector spaces and their subspaces, and to understand linear combinations, spans, dependencies, bases and dimensions in vector spaces. 				
8	forms, elementary matrices, rank of m	ts will be able to oncepts such as system of linear equations, row echelon atrix, vector spaces, subspaces, and basis. sian elimination and Cramer's Rule to solve systems of			

	ear equations.
	C3: Analyse the relationships between linear independence, basis, dimension, and spanning
	s within vector spaces and verification of basis.
	C4: Evaluate the rank of matrix, sum and intersection of subspaces and check whether the ion of subspaces is a subspace.
	C5: Construct a system of linear equations with unique, infinite or no solutions and design a
	bspace of given dimension for respective vector space.
	odules: -
Μ	odule 1: System of Linear Equations and Matrices (15 Lectures)
	1. Systems of homogeneous and non-homogeneous linear equations, Simple examples of
	finding solutions of such systems, Geometric and algebraic understanding of the
	solutions, Matrix representation of systems of linear equations (both homogeneous and
	non-homogeneous).
	2. Elementary row and column operations; Row reduction (of a matrix to its row echelon
	form); Gaussian elimination, Applications of solving systems of linear equations with
	examples.
	3. Elementary matrices and their relationship with elementary row operations
	Invertibility of elementary matrices. Consequences such as: a square matrix is
	invertible if and only if its row echelon form is invertible, and invertible matrices are
	products of elementary matrices.
	4. Notion of row rank and column rank with examples. Equivalence of the row rank and
	the column rank (without proof). Invariance of rank upon elementary row or column
	operations.
	5. Necessary and sufficient condition for a system of non-homogeneous linear equations
	to have a solution [viz., the rank of the coefficient matrix equals the rank of the
	augmented matrix [A B]]. Equivalence of statements (in which A denotes an $n \times r$
	matrix) such as (i) The system $AX = b$ of non-homogeneous linear equations has a
	unique solution.
	(ii) The system $AX = 0$ of homogeneous linear equations has no nontrivial solution.
	(iii) A is invertible.
	(iv) det $A = 0$.
	$(v) \operatorname{rank}(A) = n.$
	Cramer's Rule.
M	odule 2: Vector Spaces (15 Lectures)
	1. Definition of a vector space over \mathbb{R} . Subspaces; criterion for a nonempty subset to be a
	subspace of a vector space. Examples of vector spaces, including the Euclidean space
	\mathbb{R}^n , Row space and the column space of a matrix as examples of vector space, space of
	polynomials, space of various types of matrices, space of real valued functions on a set.
	2. Intersections, union and sums of subspaces. Direct sums of vector spaces.
	3. Linear combination of vectors. Linear span of a subset of a vector space. Definition of
	a finitely generated vector space. Linear dependence and independence of subsets of a vector space.
	4 Basis of a vector space Verification of basis of vector space through examples

4. Basis of a vector space. Verification of basis of vector space through examples. Dimension of a vector space. Examples. Bases of a vector space as a maximal linearly

		independent sets and as minin	nal generating	g sets (without proof).

Name of the Course: Indian Mathematics

Sr.	Heading	Particulars		
No.				
1	Description the course: Including but not limited to:	The course is designed to have glimpses of the vast mathematical knowledge that Indians had in ancient/medieval times. The learner is encouraged to learn, understand and practice the different methods given by Indian mathematicians for solving various problems. From basic Arithmetic and Geometry to the higher Math concepts like Combinatorics and Calculus, the contribution of Indian mathematicians is notable and the learner is expected to develop justified pride about their own ancestors and gain some motivation towards furthering the subject by contributing via research.

8	 This course provides an introduction to the work of Indian mathematicians and its relevance in todays world. It aims to provide knowledge to students about contribution and innovations of Indian Mathematicians. This course is designed with following objectives. CO1: To introduce students to the significant mathematical contributions of ancient Indian scholars, including Aryabhata, Brahmagupta, Bhaskara and Madhava CO2: To study mathematical concepts found in Vedic texts, including the Sulba Sutras, and their applications in geometry, algebra, and number theory. CO3: To analyze the development of the Indian decimal number system, place value notation, and the invention of zero. CO4: To understand the mathematical principles used in Indian astronomy and their applications in architecture and engineering. 			
	 After completion of the course, students will be able to OC1: understand and recall the methods of obtaining square roots and cube roots, results related radius and diameter and the contributions of Indian Mathematicians OC2: explain Pythagorean triplets as appeared in Shulbasootras, impossibility of square root of negative numbers, expressed by Indian mathematicians, Varga-Sankramana, etc. OC3: apply Indian ancient methods to find squares and cubes, volume of a sphere given by Bhaskaracharya, volume of pyramid given by Brahmagupta etc. OC4: analyse the problem of Kuttaka and the methods given by Bhaskaracharya, the problem of Varga Prakriti and the method given by Bhaskaracharya. OC5: create counter examples Pythagorean triplets. 			

9	Modules:- Module 1: Arithmetic, Algebra and Combinatoric	s						
	1. The Zero and the Decimal System: The early appea							
	2. Terms for the multiples of ten like 10, 20, 30 etc.							
	10, given by Aryabhat, Mahaviracharya and Bhaskar	•						
	3. The elementary operations like addition, subtraction, multiplication, division. Operations we fractions. Operations with zero. Squares and Cubes. Methods to obtain square roots and cu roots, given by <i>Aryabhat</i> and <i>Bhaskaracharya</i> . Impossibility of square root of negative numbe expressed by Indian mathematicians. Varga-Sankramana, Quadratic Equation							
	4. Trairashik, Vyasta-Trairashik, Paanchrashik, Saaptarashik5. The problem of Kuttaka and the methods given by <i>Brahmagupta</i> and <i>Bhaskaracharya</i>. The							
	problem of Varga Prakriti and the method given by B							
	6. Progressions and Series.7. Combinatorics as in <i>Pingala's</i> Chhanda:shastra and	d <i>Rhaskaracharva</i> 's Anknaash						
	Module 2: Geometry, Trigonometry, Calculus and							
	 Area of triangle. Area of rectangle. Area of cyclic of rhombus, parallelogram given by <i>Bhaskaracharya</i>. Circumference and area of a circle. The value of parallelogram given by <i>Bhaskaracharya</i>. 	c quadrilateral given by <i>Brahmagupta</i> . Area . Area of trapezium by <i>Bhaskaracharya</i> pi as given by <i>Aryabhat</i> , and as appeared in						
	Shulba-sootras. Results related to radius and diameter 3. Volume of a sphere given by <i>Bhaskaracharya</i> , V							
	Circumference of ellipse	or of the or pyramid given by <i>Branmagapia</i> .						
	4. Pythagoras theorem as given by <i>Aryabhat</i> . Pythag	gorean triplets as appeared in Shulbasootras.						
	The "sine-value" table as given by Aryabhata							
	5. Rudiments of Calculus. <i>Madhava's</i> Infinite series f	for sine, cosine, arctangent and pi						
	6. Contribution towards Astronomy							
	Additional/Further Reading

1	Description the course:Problem-solving is a fundamental aspect of any Mathema course. While advanced courses often emphasize theoretical nature of the subject, engaging in problem-solv reinforces concepts and enhances learners' ability to anal existing problems and devise solutions. This activity not o motivates learners but also empowers them to formulate in results, propose conjectures, and develop innovative theoriesVertical:Major		
2	Vertical:	Major	
3	Туре:	Practical	
4	Credits:	2 credits (1 credit = 15 Hours for Theory or 30 Hours of Practical work in a semester)	
5	Hours Allotted:	60 Hours	
6	Marks Allotted:	50 Marks	
7	Algebra and Analysis with rig CO1. To give sufficient k perception of numerous pow by modelling, solving and int CO2. To reflect the broad continuing further study in va CO3. To enhance students' of power of communication. Th CO4. To give adequate exp explore many aspects of Mat	nature of the subject and develop mathematical tools for arious fields of sciences. overall development, problem solving skills, creative talent, and ese are necessary for various kinds of employment. posure to global and local concerns that would help learners	
8	 Course Outcomes (OC): After completion of the course, students will be able to OC1: Apply the formulae and concepts to solve the examples related to series, Riemann Integral, area between two curves, Gaussian elimination method etc. OC2: Analyze the convergence and divergence of series and integrability of given function and explore the fundamental properties of vector spaces and subspaces, including their intersections, unions, sums, and direct sums. OC3: Justify/ check the integrability of function, absolute and conditional convergence of series and examine and evaluate linear combinations, linear spans, and linear dependence and independence in vector spaces. OC4: Construct counter examples related to absolutely convergent/ divergent series, non-integrable functions etc. and formulate and validate results related to system of non -homogeneous linear equations and application of Cramer's rule. 		
9	Modules: - Module 1: Practical for Real		

	1.	Convergent and divergent series and algebra of convergent series.				
	2.	Comparison and limit comparison test.				
	3.	Ratio test and root test.				
	4.	Alternating Series and p-series test.				
	5.	Absolute and conditional convergence.				
	6.	Upper sum and lower sum.				
	7.	Riemann integral and its properties.				
	8.	Fundamental Theorems of Calculus.				
	9.	Area between two curves, lengths of plane curves and surface area of				
		surfaces of revolution.				
	10.	Beta and Gamma functions.				
	Modu	ıle 2: Practical for Linear Algebra I (30 Hours)				
	1.	System of homogeneous and non-homogeneous linear equations				
	2.	Gaussian elimination method				
	3.	Elementary row (column) operations and elementary matrices				
	4.	Row space, column space, row rank and column rank				
	5.	System of linear equations (using determinants) and Cramer's rule				
	6. Vector spaces and subspaces					
	7. Intersection, union, sum and direct sum of subspaces					
	8.	Linear combinations and linear span of a subset				
	9.	Linear independence and dependence				
	10.	Basis and dimension of vector spaces

Vertical – 4 (VSC)

Name of the Course: Advanced Python (VSC)

Sr.	Heading	Particulars
No. 1	Description the course: Including but not limited to:	This course will equip undergraduate students with essential skills in numerical and scientific computing using Python, preparing them for careers in data science, engineering, and applied sciences. It focuses on four essential libraries— NumPy (for array-based numerical computations), SciPy (for advanced scientific
		functions including problem solving in mathematics), Pandas (for data manipulation and analysis) and Matplotlib (for creating visual representations of data). Students will gain practical experience in using four libraries to solve real-world problems, including numerical equation solving, performing matrices and system of equations, and applying statistical methods for data analysis. The course emphasizes the application of these techniques to data science, showing how numerical computing can be applied to fields such as engineering, economics, and research. Additionally, the course covers basic statistical analysis to help interpret data and solve real-world data science problems. By the end of the course, students will have the skills needed to efficiently perform numerical computations, analyze complex datasets, and visualize data effectively, making this course a valuable foundation for anyone working in data science or related fields.
2	Vertical:	Vocational Skill Course

8	Course Outcomes (OC):
U	After completion of the course, students will be able.
	OC1: Apply NumPy, SciPy, Pandas, Matplotlib functions to solve numerical, statistical,
	optimization problems and System of equations.
	OC2: Analyze clear and insightful data visualizations using these packages.
	OC3: Perform numerical computations on multi-dimensional arrays using these packages.
	OC4: Design programs for effective data manipulation, visualization, and analysis of small
	datasets.
9	Modules: -
	Module 1: Numerical Computing with Python (30 Lectures)
	1. Introduction to Data Analysis: Date Analysis: Understanding the Nature of the Data,
	the data analysis process including Problem definition, Data extraction, Data cleaning,
	Data transformation, Data exploration, Predictive modelling, Model, validation/test,
	Visualization and interpretation of results, Deployment of the solution, Quantitative and
	Qualitative Data Analysis
	2. Review of Python: Python Interpreter, IPython Notebook, Anaconda
	distributor, Google Colab, Introduction to Jupyter Notebooks and installation,
	Modules in python.
	2 Vectors Matrices and Multidimensional Arroys with Number Importing
	3. Vectors, Matrices, and Multidimensional Arrays with NumPy: Importing
	modules through the NumPy Library, NumPy Array objects, creating arrays, Indexing, slicing, and reshaping arrays, Vectorized expressions including arithmetic
	operations, operations on arrays, matrix and vector operations. Problems on Array
	manipulations, mathematical operations with NumPy, Reading and Writing Array Data
	on Files
	4. Data Processing and Analysis with Pandas: Introduction to pandas, Data
	Structures
	a) Series – Declaring series, Selecting the Internal Elements, Assigning Values to
	the Elements, Defining Series from NumPy Arrays and Other Series, Filtering
	Values, Evaluating Values, NaN Values, Series as Dictionaries, Operations
	between Series
	b) DataFrame - Defining a DataFrame, Selecting Elements, Assigning Values,
	Membership of a Value, deleting a Column, Filtering, DataFrame from Nested dict,
	Transposition of a DataFrame, indexing
	$\mathbf{M}_{\mathbf{r}}$ below $\mathbf{C}_{\mathbf{r}}$
	Module 2: Scientific Computing with Python (30 Lectures)
	1. Reading and Writing Data with Pandas - I/O API Tools- readers and writers,
	CSV and Textual Files, Introduction to The Seaborn Graphics Library
	2. Plotting and Visualization with Matplotlib: Introduction to data visualization,
	Matlotlib architecture, Pyplot, Use of the kwargs, Creating line plots, scatter plots,
	bar charts, and histograms, Customizing plots: titles, labels, legends, and styles
	oar charts, and instograms, Customizing piots. thres, labels, legends, and styles

3. Scientific Computation with SciPy: Introduction to the SciPy library, Optimization, Overview of SymPy,

a) Matrix operations: addition, multiplication, transpose, inverse, Solving System of linear equations, Square and rectangular Systems

b) Statistics- Review of Statistics and Probability, importing stats module in SciPy, compute the mean, median, variance and standard deviation of a dataset, random numbers.

List of Practical

Module1: Numerical Computing with Python Practical based on NumPy array objects, creating arrays, Indexing, slicing, and 1 reshaping arrays. Practical based on vectorized expressions including arithmetic operations, operations 2 on arrays. Practical based on matrix and vector operations. 3 4 Practical based on array manipulations, mathematical operations with NumPy. 5 Practical based on reading and Writing Array Data on Files. 6 Practical based on declaring series, selecting the Internal Elements, Assigning Values to the Elements. Practical based on defining Series from NumPy Arrays and other Series, Filtering 7 Values, Evaluating Values, NaN Values. Practical based on series as Dictionaries, Operations between Series. 8 9 Practical based on defining a DataFrame, Selecting Elements, Assigning Values, Membership of a Value, deleting a Column, Filtering. Practical based on DataFrame from Nested dict, Transposition of a DataFrame, indexing. 10 Module2: Scientific Computing with Python Practical based on reading and writing Data with Pandas, readers and writers, CSV and 1 Textual Files. Practical based on data visualization with Matlotlib, Pyplot. 2 3 Practical based on creating line plots, scatter plots with Matlotlib. 4 Practical based on creating bar charts, and histograms with Matlotlib. Practical based on Customizing plots: titles, labels, legends, and styles with Matlotlib. 5 Practical based on Matrix operations: addition, multiplication with SciPy. 6 7 Practical based on Matrix operations: transpose, inverse with SciPy. 8 Practical based on Solving System of linear equations, Square and rectangular Systems with SciPy. 9 Practical based on importing stats module in SciPy, to compute the mean and median of dataset. Practical based on to compute variance and standard deviation of a dataset, random 10 numbers.

Sem. – IV

Vertical – 1 Major

Syllabus B.A./ B.Sc. (Mathematics) (Sem.- IV) (MAJOR) Name of the Course: Multivariable Calculus

Sr. No.	Heading	Particulars	
1	Description the course: Including but not limited to:	Multivariable calculus finds extensive applications in diverse fields such as Physics, Chemistry, Biotechnology, Engineering, and more. This course seeks to provide learners with a comprehensive understanding of Multivariable Calculus, building upon a rigorous foundation laid by Mathematical Analysis. Through the exploration of various properties of derivatives of scalar fiel ds and vector fields. Students will gain valuable insights into the analytical aspects of Multivariable Calculus. To enhance practical understanding, the course incorporates real-world applications of differentiation in multiple dimensions, allowing learners to grasp the diverse uses of the acquired knowledge.	
2	Vertical:	Major	
3	Туре:	Theory	
4	Credits: Hours Allotted:	2 credits (1 credit = 15 Hours for Theory or 30 Hours of Practical work in a semester) 30 Hours	
6	Marks Allotted:	50 Marks	
7	Course Objectives (CO):This course aims to equip students with a comprehensive understanding of functions of several variables and the principles of differentiation for scalar and vector fields in multivariable calculus.CO1: To develop the understanding of vectors in \mathbb{R}^n focusing on \mathbb{R}^2 and \mathbb{R}^3 and acquire proficiency in working with real-valued functions of several variables.CO2: To demonstrate competence in analyzing neighbourhoods in \mathbb{R}^n and applying concepts of limits and continuity to scalar fields.CO3: To define and compute partial and directional derivatives of scalar fields, focusing on \mathbb{R}^2 and \mathbb{R}^3 , and understand the Mean Value Theorem for scalar fields.CO4: To explore the basic properties of differentiability, such as continuity at a point, existence of partial derivatives, and differentiability when partial derivatives exist and are continuous.CO5: To utilize concept of differentiation for practical applications, including the		

 erstanding of tangent planes and maxima-minima. 5: To understand higher-order partial derivatives and their applications, including the ed Partial Derivatives Theorem, Taylor's Theorem for twice continuously differentiable tions, the Method of Lagrange Multipliers and the Second Derivative Test for functions of variables. rrse Outcomes (OC): rr completion of the course, students will be able C1: understand and remember the concepts such as Euclidean spaces, norm, inner oduct, limit, continuity, derivatives of scalar fields etc. C2: apply first and second derivative tests to find extreme values of scalar fields. C3: verify the relationship between Differentiability and Continuity, directional derivative d continuity etc. C4: check differentiability and continuity of scalar and vector fields. C5: create counter examples related to continuity and differentiability, directional derivatives and total derivative etc. Intes: - Integer of several Variables (15 Lectures) I Review of vectors in Rⁿ [with emphasis on R² and R³] and basic notions such as addition and scalar multiplication, inner product, length (norm) and distance between two points. 2 Real-valued functions of several variables (Scalar fields). Graph of a function. Level sets (level curves, level surfaces, etc.). Examples. Vector valued functions of several variables (Vector fields). Component functions. Examples. 3 Sequence in Rⁿ [with emphasis on R² and R³] and their limits. Neighbourhoods in Rⁿ. I limite and continuity of coalar fields?
 rse Outcomes (OC): rr completion of the course, students will be able C1: understand and remember the concepts such as Euclidean spaces, norm, inner oduct, limit, continuity, derivatives of scalar fields etc. C2: apply first and second derivative tests to find extreme values of scalar fields. C3: verify the relationship between Differentiability and Continuity, directional derivative ad continuity etc. C4: check differentiability and continuity of scalar and vector fields. C5: create counter examples related to continuity and differentiability, directional derivative and continuity, partial derivatives and total derivative etc. Indes: - Indes: - Indes: - Indes: and scalar multiplication, inner product, length (norm) and distance between two points. 2 Real-valued functions of several variables (Scalar fields). Graph of a function. Level sets (level curves, level surfaces, etc). Examples. Vector valued functions of several variables (Vector fields). Component functions. Examples. 3 Sequence in Rⁿ [with emphsis on R² and R³] and their limits. Neighbourhoods in Rⁿ.

 sets (level curves, level surfaces, etc). Examples. Vector valued functions of several variables (Vector fields). Component functions. Examples. 3 Sequence in Rⁿ [with emphsis on R² and R³] and their limits. Neighbourhoods in Rⁿ.
Limits and continuity of scalar fields. Sequential characterizations (without proof), Composition of continuous functions. Algebra of limits and continuity (Results with proofs). Iterated and simultaneous limits of scalar fields. Limits and continuity of vector fields. Algebra of limits and continuity of vector fields. (without proofs).
Partial derivatives, directional derivatives and gradient of scalar fields (with emphasis on \mathbb{R}^2 and \mathbb{R}^3). Directional Derivative and Continuity, Mean Value Theorem for scalar fields.
5 Differentiability of scalar fields (in terms of linear transformation). Concept of total derivative and its uniqueness, basic results such as (i) continuity at a point of differentiability, (ii)existence of partial derivatives at a point of differentiability and (iii) differentiability when the partial derivatives exist and are continuous.
lule 2: Applications of Differentiability (15 Lectures)
Relation between total derivative and gradient of a function. Chain rule (without proof). Geometric properties of gradient. Tangent planes.
Euler's Theorem, Higher order partial derivatives. Mixed Partial Derivatives Theorem (n=2).
3 Taylor's Theorem for twice continuously differentiable functions (without proof).
⁴ The maximum and minimum rate of change of scalar fields. Notions of local maxima, local minima and saddle points. First Derivative Test. Examples. Hessian matrix. Second Derivative Test for functions of two variables (statement only). Examples. Method of Lagrange Multipliers.

Name of the Course: Linear Algebra - II

Sr. No.	Heading	Particulars	
1	Description of the course: Including but not limited to:	This course offers a comprehensive introduction to linear transformations, eigenvalues, eigenvectors, inner product spaces, and matrix diagonalization. Topics include null spaces, images, Rank-Nullity Theorem, eigenspaces, the characteristic polynomial, and applications of the Cayley-Hamilton Theorem. Students will learn about norms, orthogonality, the Gram- Schmidt process, and matrix diagonalization, including the Spectral Theorem for real symmetric matrices and quadratic forms. These concepts have real-world applications in computer graphics, signal processing, machine learning, quantum mechanics, and optimization, equipping students to tackle practical problems in science and engineering.	
2	Vertical:	Major	
3	Туре:	Theory	
4	Credits:	2 credits (1 credit = 15 Hours for Theory or 30 Hours of Practical work in a semester)	
5	Hours Allotted:	30 Hours	
6	Marks Allotted:	50 Marks	
7	 Course Objectives (CO): The course aims to equip students with a comprehensive understanding of linear transformations and inner product spaces, focusing on key elements like eigenvalues, eigenvectors, orthogonalization, diagonalization orthogonal diagonalization, and quadratic forms. It introduces diverse techniques for analyzing linear transformations, enhancing students' numerical aptitude in linear algebra through the application of ranks, matrices. Furthermore, the course emphasizes the development of proficiency in inner product spaces, ensuring a deep grasp of foundational concepts. CO1: Develop a solid understanding of linear transformations and their properties, providing the foundation for advanced applications in various fields. CO2: Explore the concepts of eigenvalues and eigenvectors, understanding their significance in linear transformations and matrices. CO3: Apply the Rank-Nullity Theorem to relate the rank and nullity of linear transformations, connecting algebraic and geometric perspectives. CO4: Achieve proficiency in expressing linear transformations through matrix representation and understand how alterations in bases affect matrices, facilitating a more profound comprehension of the topic. CO5: Comprehensive understanding of inner product spaces, orthogonality, and diagonalization, with applications in real-world problems such as conic sections and quadratic forms. 		

8	Course Outcomes (OC):				
U	After completion of the course, students will be able to				
	OC1: Understand linear transformations, kernel, image, rank, null	lity, associated matrices, inner			
	product spaces, orthogonality of vectors and diagonalization of ma	•			
	OC2: Apply the Cayley-Hamilton theorem to find inverse, power				
	orthogonalization process to find orthogonal/orthonormal sets.				
	OC3: Analyse diagonalizable and orthogonally diagonalizable	matrices, and verify linear			
	isomorphism, rank-nullity theorem for linear transformations,				
	triangle inequality.	Sudding Sentruiz mequancy,			
	OC4: Evaluate kernel, image, eigenvalues, eigenvectors, alge	braic multiplicity geometric			
	multiplicity, angle between vectors and orthogonal complement of subspace.

1	Description the course: Including but not limited to:	Problem solving forms one of the basic aspects of any course in Mathematics. Higher courses in Mathematics focus mainly on the theoretical nature of the subject, nevertheless, the problem- solving activity strengthens the concepts and helps the learners develop their ability to think over the existing problems in the subject, and also to create and crack new problems! This way a learner is not just motivated, but elevated also, to formulate new results, suggest new postulates (usually known as conjectures), and design new theories.		
2	Vertical:	Major

6 7	Marks Allotted:	50 Marks		
	 Course Objectives (CO): This course introduces basic concepts of Calculus, Linear Algebra and differential equation with rigour and prepares students to study further courses. CO1. To give sufficient knowledge of fundamental principles, methods, and a clear perception of numerous powers of mathematical ideas and tools and the skills to use them by modelling, solving and interpreting. CO2. To reflect the broad nature of the subject and develop mathematical tools for continuing further study in various fields of sciences. CO3. To enhance students' overall development, problem solving skills, creative talent, and power of communication, which are necessary for various kinds of employment. CO4. To give adequate exposure to global and local concerns that would help learners explore many aspects of Mathematical Sciences. 			
8	 Course Outcomes (OC): After completion of the course, students will be able OC1: apply first and second derivative tests to find extreme values of scalar fields, compute eigenvalues and eigenvectors, apply the Cayley-Hamilton theorem, and understand inner product spaces and related inequalities and also apply the various methods to solve ordinary linear differential equations. OC2: verify the relationship between Differentiability and Continuity, directional derivative and continuity etc. OC3: check differentiability and continuity of scalar and vector fields and evaluate the complementary function and particular integral of given ordinary linear differential equations. OC4: create counter examples related to continuity and differentiability, directional derivative and continuity, partial derivatives and total derivative etc and construct 			

	ort	hogonal and orthonormal sets using the Gram-Schmidt process and compute orthogonal

	Paper pattern of the Test (Off						
	Mode):	inne					
	· · · · · · · · · · · · · · · · · · ·	iple					
	Q1: (Attempt any 5 from 8) Multiple choice questions. (10 marks: 5×2)						
	Duration: 1Hrs						
	Duration: 1Hrs While setting question paper						
	Duration: 1Hrs						

14 Format of Question Paper:

Scheme of examination:

At the end of the Semester III, Practical examinations of three hours duration and 30 marks shall be conducted based on both the modules.

Paper pattern: The question paper shall have two questions.

Q. No. 1	Five out of Eight multiple choice questions (four from module 1 and four from module 2) (OC1 to OC3)	Marks $(3 \times 5 = 15$ Marks)
Q. No.2	Attempt any Two out of Four (two from module 1 and two from module 2). (OC3 and OC4)	$(5 \times 2 = 10)$ Marks)

Marks for Journals:

For both Module 1 and Module 2

1. Journal: 5 marks (2.5 marks for each module 1 & module 2)

The students are required to perform 75% of the Practical for the journal to be duly certified. The students are required to present a duly certified journal for appearing at the practical examination, failing which they will not be allowed to appear for the examination.

Vertical – 4 (SEC)

Name of the Course: JAVA Programming (SEC)

Sr.	Heading	Particulars			
No. 1	Description the course: Including but not limited to:	This course is designed to provide a comprehensive introduction to the Java programming language. Java is a versatile, high-level, and object-oriented programming language widely used in various applications, including web development, mobile applications, and large-scale enterprise systems. This course will cover the fundamental concepts of Java, including basic syntax, data types, control structures, object-oriented programming (OOP), and key features such as inheritance and exception handling. Additionally, students will be introduced to basic graphics programming to create simple graphical applications. Whether you are new to programming or transitioning from another language, this course will equip you with the knowledge and skills to develop basic Java programs and understand core programming principles.			
2	Vertical:	Skill Enhancement Course			
3	Type: Practical				
4	Credits: 2 credits (1 credit = 15 Hours for Theory or 30 Hours of Practic work in a semester)				
5	Hours Allotted: 60 Hours				
6	Marks Allotted: 50 Marks				
7	Course Objectives (CO): CO1: Understand the fundamental concepts of Java programming, including data types, variables, operators, and control structures (loops, conditionals, etc.). CO2: Apply object-oriented programming (OOP) principles such as classes, objects, encapsulation, inheritance, and polymorphism. CO3: Develop Java programs that implement inheritance to create hierarchical relationships between classes. CO4: Handle errors and exceptions effectively using Java's exception handling mechanisms. CO5: Explore basic graphical programming in Java to create simple graphical user interfaces (GUIs). CO6: Gain hands-on experience through coding exercises, developing the ability to write, compile, and run Java applications. CO7: Build a strong foundation in Java, preparing for more advanced topics and further learning in software development.				
8	Course Outcomes (OC): Upon successful completion of the course, students will be able to:				
	• OC1: Apply Java's basic syntax, control structures, and standard libraries to write and				

9	 analyze programs effectively. OC2: Analyze and design Java programs that efficiently handle operations on arrays, matrices, and strings, applying appropriate algorithms for problem-solving. OC3: Perform object-oriented programming concepts such as encapsulation, inherita and polymorphism in Java applications. OC4: Design interactive applications using Java's built-in libraries by creating and implementing basic graphics and graphical user interfaces. Modules: - 							
	Module 1: Introduction to Java Programming (30 Lectures)							
	1.	Introduction to Java programming.						
		 a) Object oriented programming (OOPs) approach: Different types of programming approach, basic concept of object-oriented programming (OOPs) approach like objects and classes, Data Abstraction, Data Encapsulation, Inheritance, polymorphism, benefits OOPs. b) Introduction to Java: History of Java, features of Java, Java environment, Writing a simple java program with output (Using <i>sytem. out. println</i>() or similar functions) and input (using Scanner class methods <i>nextInt()</i>, <i>nextFloat()</i>, <i>nextLine()</i>). c) Basic of Java: Java tokens, keywords, literals, constants, backslash character constants (program to illustrate the use of all types of backslash characters), different data types used in Java (a program to illustrate methods to input all types of data and printing them), variables (declaration and assigning values) (a program to illustrate defining different types, 						
	2.	Basic of Java programming:						
		 a) Operators and expression: Arithmetic, Relational, logical, assignment, increment and decrement operators, conditional operators (programs to illustrate the use of each type of operators) b) Java control statements: if, if else, if else if, else statements. Switch statement (programs to illustrate all control statements). c) Java Loop statements: for loop, while loop and dowhile loop (programs to illustrate use of all types of loop statements in Java). d) Use of break and continue statements in loops (programs to illustrate break and continue statements). 						
	3. Arrays in Java:							
		a) Defining one dimensional array, assigning and accessing its elements, programs like finding maximum, minimum value in array, sorting of array, finding mean, median and mode of data.						
		b) Defining two-dimensional array, assigning and accessing its element. Programs like writing a matrix using two-dimensional array, its transpose, matrix addition, matrix multiplication, determinant of 2 × 2 and 3 × 3 matrices.						
		c) Creating string, accessing characters in string, basic string methods (programs to illustrate creation of string, displaying its each characters, string operations, and modification of string using string methods)						

Module 2: Object oriented programming in Java and Java Applets (30 Hours) Class and objects: 1. a) Class, defining member variables and member methods, creating objects of the class, accessing members variables and member methods using objects (programs to declare more than one classes with member variables, member methods, access these members using different objects of class). Method overloading (programs to illustrate method overloading). Use of *this* operator (programs to illustrate *this* operators) b) Constructors (default and parametrized), calling another constructor, constructors overloading. Use of this operator in constructors. Constructors overloading (programs to illustrate each aspect of constructors) c) Finalize methods, abstract classes and abstract methods. Different types of class access modifier. Inheritance in Java: 2. a) Inheritance and its types, super and sub class, extends keyword (programs to illustrate inheritance between two or more classes). Subclass constructor, use of *super* keyword (program to illustrate *super* keyword), method overriding (program to illustrate method overriding), final variables, final methods and final classes. Concept of interface. b) Exception handling in Java: Types of error in java program, exception, common types of exception, Need for Exception Handling, Exception Handling techniques: try and catch, multiple catch statements, finally block, usage of throw and throws. Concept of packages (programs to illustrate exception handling in java). 3. Applets programming in Java: a) Applet and difference between applet and application program, creating applets, applet life cycle. b) Basic of HTML, designing webpage, applet tag, passing parameters to applet, getting input from user (programs to illustrate creation and running of applets in HTML tag) c) Font class. (program to display different fonts) d) Graphic class, drawing of basic shape, drawing of lines, circles, arcs, ellipse, arcs, rectangle etc. color methods. (Programs to illustrate to make different figures, filled with different colors)

	List of Practical					
	Module 1: Basic of Java Programming.					
	Practical 1: Basic input output programs in Java					
	Practical 2: Declaring and accepting values in variables of different type, programs to illustrate the concept of type casting.					
	Practical 3: Programs to illustrate different types of operators used in Java.					
	Practical: 4: Programs to illustrate control statement if else if else.					
	Practical 5: Programs to illustrate control statement switch case.					
	Practical 6: Programs to illustrate for loop in Java					
	Practical 7: Programs to illustrate while loop and dowhile loop.					
	Practical 8: Programs to create one dimensional array, finding maximum, minimum of array, sorting of array.					
	Practical 9: Programs to create two-dimensional array, some basic matrix operations using two-dimensional array.					
	Practical 10: Programs to illustrate string input, slicing of string.					
	Module 2 Object oriented programming in Java and Applet Programming.					
	Practical 1: Creation of class and its object, accessing class members using objects.					
	Practical 2: Programs to illustrate the concept of method overloading in Java and use of this operator.					
	Practical 3: Creation of constructor, constructor overloading, use of this operators in constructors.					
	Practical 4: Programs to illustrate finalize methods, abstract classes and abstract methods.					
	Practical 5: Programs to illustrate the concept of inheritance in Java.					
	Practical 6: Programs to illustrate the concept of method overriding and use of super keyword.					
	Practical 7: Programs to illustrate the concept of exception handling in Java.					
	Practical 8: Programs to create simple applets, passing values to applets.					
	Practical 9: Programs to display text in different fonts, size and colors.					
	Practical 10: Programs to create basic shape using java applets.
